

Title of the presentation

Name: Yasushi Matsumoto

Affiliation:

Division of Development and Discovery of Interventional Therapy,

Tohoku University Hospital, Japan

Purpose:

Various endovascular methods have been developed to treat neurovascular diseases. Recently i-ED COIL system (KANEKA, Tokyo, Japan) was launched for use at both finishing stage and filling stage during coil embolization showing excellent performance with softness and minimized microcatheter movement and uniform distribution regardless irregular shape of aneurysm. After the launch in Japan, KANEKA has been able to sell over 48,000 coils owing to supportive Japanese neuro surgeons and good product reputations. For global distribution, KANEKA gained US-FDA approval and started distribution at stroke centers in US.
